

Introduction

Do Americans view lesbian and gay (LG) migrants as more deserving to enter the country than their straight counterparts? This question has yet to be evaluated, but is important to address for two reasons. First, recent changes in federal policy have contributed to significant increases in LG migrants coming to the U.S. (Vogler 2016). According to American Community Survey data, numbers of different-sex couples including immigrants increased by 22 percent from 2008 to 2019 (from 7.8 million to 9.5 million), while those of corresponding same-sex couples grew from 44 thousand to 107 thousand in the same period, an increase of 140 percent (Hoffmann and Velasco 2023). Despite this growth, how Americans view these types of migrants is unknown. Second, while Americans are increasingly polarized on their views toward migration, support for gay and lesbian migrants may be cross-cutting. There are now strong majorities and bipartisan support for related issues like marriage equality. Therefore, this project investigates whether sexual minorities are evaluated as more deserving due to perceived cultural similarity to the U.S. We administer a conjoint survey experiment that asks respondents to choose between two hypothetical immigrants for admission to the U.S. Respondents are also asked to choose which profile they see as more culturally similar to the U.S. This is one of the first survey experiments to examine immigrant sexuality explicitly and to directly test a cultural similarity hypothesis for immigrant deservingness.

Research Questions

1. How do U.S. citizens evaluate sexuality when making determinations of immigrant deservingness for admission? How does sexuality compare to reason for migration or skill level of the immigrant?
2. In deservingness considerations, how is perceived cultural similarity related to immigrant sexuality?
3. How do Americans' perceptions of sexual minority immigrants vary by their own political affiliation, religion, or sexuality?

Background

Previous experimental work assesses how native-born respondents evaluate the “deservingness” of migrants to gain legal entry to their country. This work broadly supports three theories of deservingness: *cultural similarity*, *economic potential*, and *humanitarian merit*.

We hypothesize that *cultural similarity* will be the primary mechanism through which Americans determine LG immigrant deservingness. The limited, relevant research that exists finds Americans to be biased against Muslims and non-English speakers while Christians and English speakers are viewed as more deserving (Bansak, Hainmueller, and Hangartner 2016; Donnalaja 2022). This work supports “norms-based,” “sociotropic” explanations (Hainmueller and Hopkins 2015). One such norm in development is that the U.S. is welcoming of lesbian and gay individuals – at least in international imagery (Snow and Cull 2020). Many right-wing parties across Western democracies, too, promote gay-friendly foreign images and national identities (Magni and Reynolds 2023). Often, this is done to justify opposition to supposedly homophobic Black, Brown, and Muslim

immigrants or to justify foreign interventions like foreign aid conditionalities (e.g., homonationalism) (Puar 2007; Kwon, Scarborough, and Taylor 2022). Thus, just like language or religion signals cultural closeness, so too will an openly gay or lesbian sexual identity.

But theories of *economic potential* have greatest empirical support. Numerous studies find that highly educated migrants working in prestigious, high-earning professions are seen as most deserving of entry (Hainmueller and Hiscox 2010; Helbling and Kriesi 2014; Hainmueller and Hopkins 2015; Donnalaja 2022). Although economic potential is not a legal consideration when awarding refugee status, respondents find hypothetical refugees with economic potential to be more deserving (Bansak, Hainmueller, and Hangartner 2016; Lawlor and Paquet 2021). And while LG Americans experience greater rates of poverty and have lower incomes compared to straight Americans, there is popular perception of this population being wealthy (DeFilippis 2016). This perception may transfer over toward the deservingness of LG migrants if Americans perceive this population as similarly being wealthy or, at least, as having greater economic potential.

Additionally, work on refugees has pointed to the importance of *humanitarian merit* in matters of deservingness. While Bansak, Hainmueller, and Hangartner (2016) find greater support in Europe for immigrants with greater economic potential, they also find that respondents favor immigrants coming for “humanitarian” rather than “economic” reasons. In the Danish context, Hedegaard (2022) finds that respondents are less likely to support climate migrants than typical refugees, but these two groups are both considered more deserving than economic migrants. As repression against LG communities increases in countries like Russia (Velasco 2023), this may prime Americans to be more sympathetic toward LG migrants on humanitarian grounds.

Methods

We use a conjoint survey experiment to isolate these components of deservingness (Hainmueller, Hopkins, and Yamamoto 2014). A conjoint design allows reliable estimation of causal effects of multiple attributes on hypothetical choices (Bansak et al. 2021). It also allows estimation of interaction effects (Egami and Imai 2019) and heterogeneous effects based on respondent attributes (Leeper, Hobolt, and Tilley 2020).

Despite the recent rise of LG immigrants in the U.S., sexuality has been under-explored in studies of immigrant deservingness.¹ We use sexual minority status as a measure of cultural similarity that overcomes these issues. Sexual minorities are present throughout the world, avoiding issues of country-level correlates. The present era is characterized by rapidly changing policies and attitudes regarding sexual minorities, as well as substantial global heterogeneity. A large majority of Americans now support same-sex marriage and other rights for same-sex couples (Ofosu et al. 2019). The proposed study will be one of the first survey experiments to consider immigrant sexuality explicitly.

To assess the degree to which sexuality matters as a sign of cultural similarity, we randomize two other attributes of cultural similarity: language and religion. To examine the cultural similarity theory explicitly, we also ask respondents to choose which profile they see as more culturally simi-

¹Lawlor and Paquet (2021) include persecution due to sexual orientation (along with religion) as a “humanitarian deservingness cues” for hypothetical asylum seeker profiles, but not for refugee profiles, and they do not disaggregate these two cues. Hedegaard (2022) list “sexuality” as a possible form of persecution for hypothetical refugee profiles, along with race, religion, nationality, or political orientation.

lar to the U.S. Furthermore, while we theorize that the deservingness of this type of immigrant may cut across typical divisions, we anticipate some heterogeneous effects across respondents. Namely, we hypothesize that respondents with greater cultural affinity with and support for LG communities will view LG migrants as more deserving. We measure the following signals of respondents' cultural closeness: educational attainment, sexual/gender minority status, political party affiliation, and religiosity.

Hypotheses

We calculate average marginal component effects (AMCEs) for the main effects and marginal means for interactions and heterogeneous effects. A positive AMCE for lesbian/gay identity implies that presentation of a lesbian/gay profile increases respondents' favorability toward admitting that immigrant, relative to a straight profile. A higher marginal mean for lesbian/gay identity implies greater likelihood of choosing lesbian/gay immigrants for admission.

- H1 (main effect): Lesbian/gay identity will have a positive AMCE, relative to straight identity.
- H2 (mediation): Respondents who are more likely to choose lesbian/gay profiles for admission will choose them as having more shared values with the U.S., on average. Controlling for this measure of cultural similarity will attenuate the AMCE for lesbian/gay identity.
- H3 (interaction): For lesbian/gay profiles, persecution will have a higher marginal mean than work as a reason for migration.

Heterogeneous effects for marginal means for lesbian/gay identity:

- H4a (education): Respondents with a bachelor's degree will have a higher marginal mean than other education levels
- H4b (political ideology): Democrats will have a higher marginal mean than Republicans
- H4c (religion): Christians will have a lower marginal mean than other groups
- H4d (sexuality): Lesbian/gay/bisexual respondents will have a higher marginal mean than straight respondents
- H4e (opinion): Respondents who worry about immigration contributing to overpopulation will have higher marginal means
- H4f (lesbian/gay contacts) Respondents who have lesbian/gay friends and family will have higher marginal means

Preliminary Results

Preliminary results for H1 and H4 are shown in Figures 1 and 3. Figure 1 shows the AMCE for all attributes. For LG profiles, we see an AMCE effect size of 0.012 in the expected direction;

respondents are 1.2 percent more likely to choose a gay or lesbian immigrant for admission to the U.S. However this effect is nonsignificant. This gives partial support for H1.

Figure 3 presents marginal means relevant for H4, yielding a number of significant results. Across education categories, respondents see straight immigrants as more deserving than LG ones. But, in line with H4a, respondents with at least a bachelor's degree see LG immigrants as more deserving than respondents with a high school or less education. However, respondents with some college see LG immigrants as the most deserving overall, complicating our theory. Democrats see LG immigrants as more deserving than straight ones, while republicans see LG ones as far less deserving. But among Democrats, LGs have a higher marginal mean, in line with H4b. Results for religion partially support H4c: Christians see LG immigrants as less deserving than atheists and the non-religious, but no less than other religious groups. If we consider sexuality, sexual minorities see LG immigrants as more deserving than straight ones, in line with H4d.

Preliminary analyses of the cultural similarity question show that profiles who are seen as more culturally similar are far more likely to be chosen. However LG profiles are seen as less culturally similar (Figure 2). For respondents who see LG profiles as more culturally similar than straight ones, they are more likely to choose the LG profiles, in line with H3.

Next Steps

We will assess the results of H2, H4e, and H4f, and more fully assess H3. We will also show results that re-weight the data to match the distribution of attributes in the U.S. population. We will place these results in theoretical context and elaborate our contributions: to clarify this area for scholars of immigration and sexual minorities, to inform policymakers of public opinion, and to provide activists for immigrant and queer rights with tools to shape their advocacy work.

Figures

Figure 1: Estimated AMCEs for admission for all attributes. Standard errors are clustered within respondent.

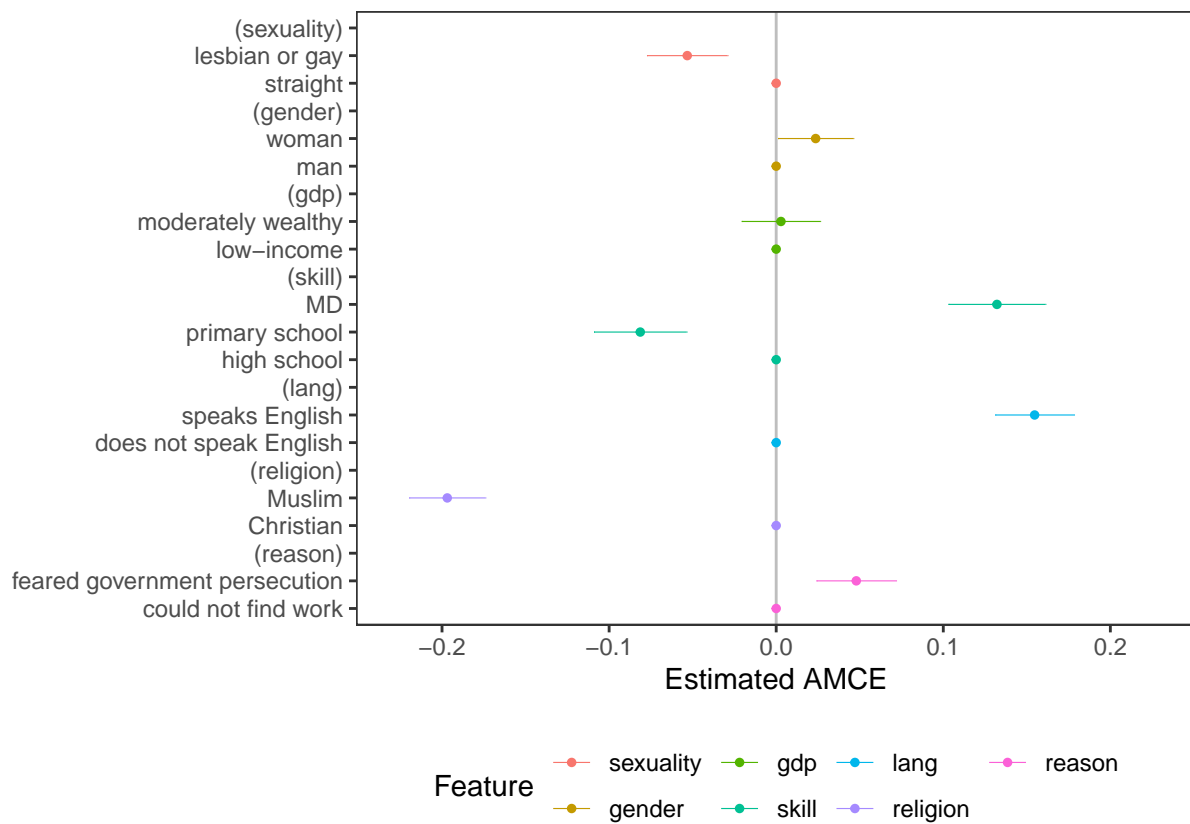

Figure 2: Estimated AMCEs for cultural similarity for all attributes. Standard errors are clustered within respondent.

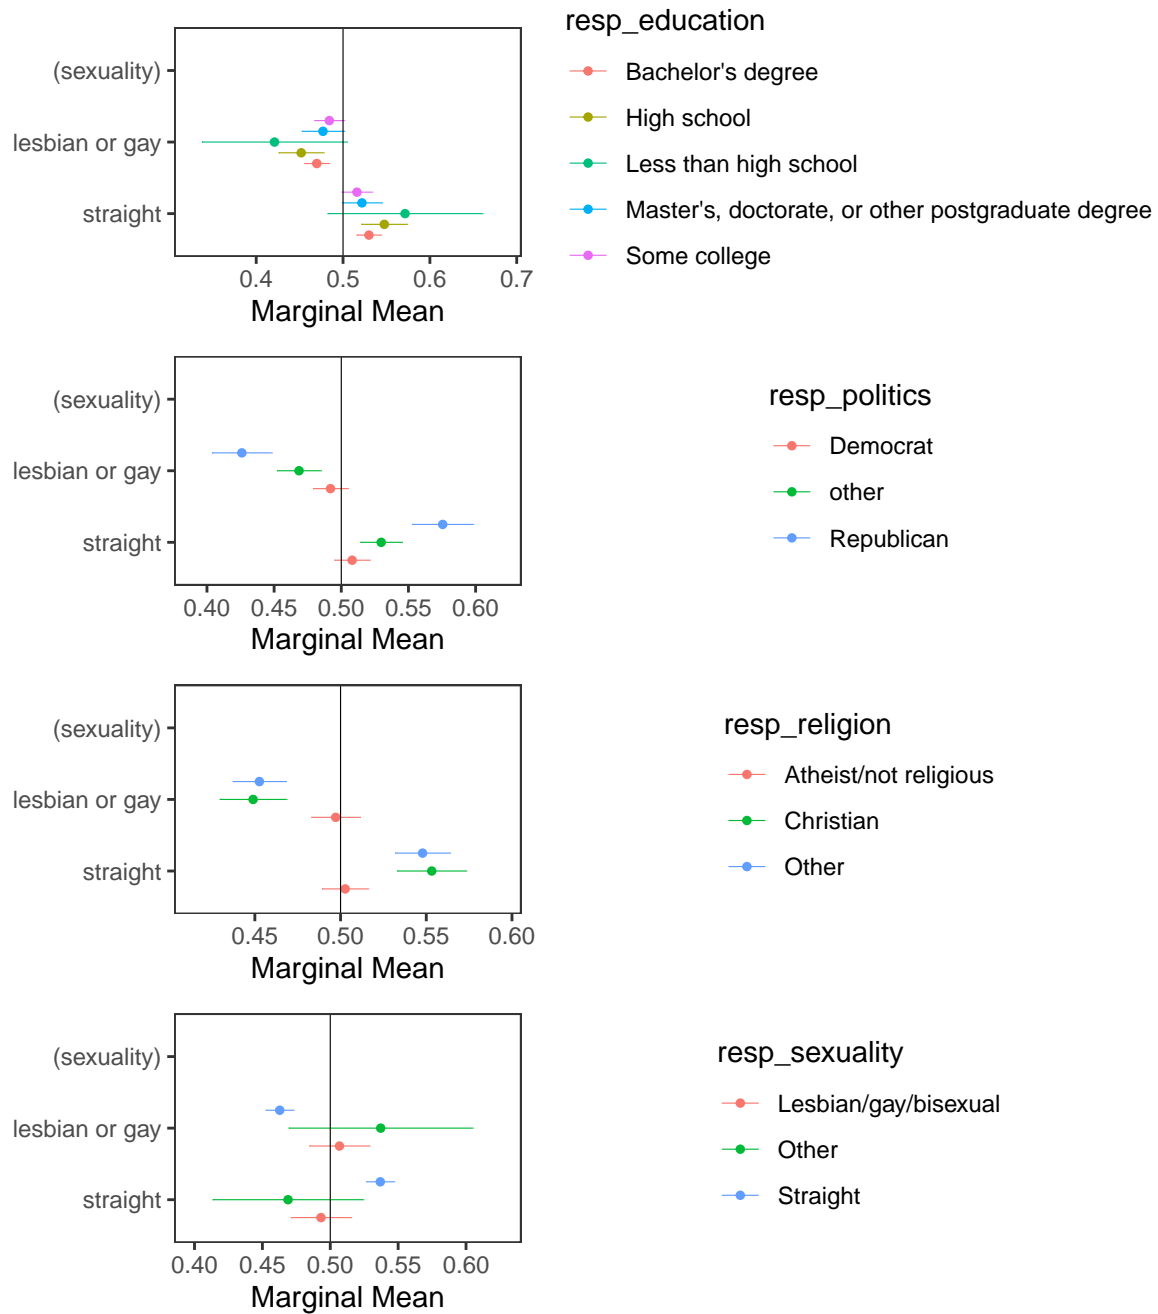

Figure 3: Marginal means. Standard errors are clustered within respondent.
